Home care for patients with suspected novel coronavirus (COVID-19) infection presenting with mild symptoms, and management of their contacts

Interim guidance

04 February 2020

Introduction

WHO has developed this rapid advice to meet the need for recommendations on safe home care for patients with suspected novel coronavirus (COVID-19) infection who present with mild symptoms¹ and on public health measures related to the management of contacts.

This document was adapted from the interim guidance that addressed Middle East respiratory syndrome coronavirus (MERS-CoV) infection that was published in June 2018 (1) and is informed by evidence-based guidelines published by WHO, including Infection prevention and control of epidemic- and pandemic-prone acute respiratory diseases in health care (2), and based on current information regarding COVID-19 infection.

This rapid advice is intended to guide public health and infection prevention and control (IPC) professionals, healthcare managers and healthcare workers (HCWs) when addressing issues related to home care for patients with suspected COVID-19 infection who present with mild symptoms and when managing contacts. This guidance is based on evidence about COVID-19 infection and the feasibility of implementing IPC measures at home. For the purpose of this document, caregivers refer to parents, spouses, other family members or friends without formal healthcare training. For COVID-19 disease case definitions, please refer to https://apps.who.int/iris/bitstream/handle/10665/330857/WHO-COVID-19-nCoV-SurveillanceGuidance-2020.3-eng.pdf.

¹ symptoms include low-grade fever; cough; malaise; rhinorrhoea; or sore throat and any warning signs, such as shortness of breath or difficulty in breathing; acute respiratory difficulty, such as sputum or haemoptysis; gastrointestinal symptoms, such as nausea, vomiting, and/or diarrhoea; and without changes in vital status, such as confusion or lethargy.

In any of these situations, patients with mild symptoms¹ and without underlying chronic conditions – such as lung or heart disease, renal failure or immunocompromising
conditions that place the patient at increased risk of developing complications – may be cared for at home. This decision requires careful clinical judgment and should be informed by an assessment of the safety of the patient's home environment.²

In cases in which care is to be provided at home, a trained HCW should conduct an assessment to verify whether the residential setting is suitable for providing care; the HCW must assess whether the patient and the family are capable of adhering to the precautions that will be recommended as part of home care isolation (e.g., hand hygiene, respiratory hygiene, environmental cleaning, limitations on movement around or from the house) and can address safety concerns (e.g., accidental ingestion of⋅ Limit the movement of the patient in the house and fire hazards associated with using alcohol-based hand sanitizers to minimize shared space. Ensure that shared spaces are 1 completely recovered and have no signs and symptoms.

A communication link with a healthcare provider or public health personnel, or both, should be established for the duration of the home care period – that is, until the patient’s symptoms have completely resolved. More comprehensive information about the mode of COVID-19 infection and transmission is required to define the

2 (e.g., kitchen, bathroom) are well ventilated (e.g., keep
• Clean and disinfect bathroom and toilet surfaces at least windows open).
• Household members should stay in a different room or, if that is not possible, maintain a distance of at least 1 m from the ill person (e.g., sleep in a separate bed).³
• Be used first for cleaning, and then, after rinsing, regular household disinfectant containing 0.5% sodium hypochlorite should be applied.⁵
• Limit the number of caregivers. Ideally, assign one person who is in a good health and has no underlying chronic or immunocompromising conditions (3). Visitors should not be allowed until the patient has completely recovered and has no signs and symptoms.
• Perform hand hygiene after any type of contact with patients or their immediate environment (4). Hand hygiene should also be performed before and after preparing food, before eating, after using the toilet and whenever hands look dirty. If hands are not visibly dirty, an alcohol-based hand rub can be used. For visibly dirty hands, use soap and water.
• When washing hands with soap and water, it is preferable to use disposable paper towels to dry hands. If these are not available, use clean cloth towels and replace them when they become wet.
• Clean the patient’s clothes, bed linen, and bath and hand towels using regular laundry soap and water or machine wash at 60°–90 °C with common household detergent, and dry thoroughly. Place contaminated linen into a laundry bag. Do not shake soiled laundry and avoid contaminated materials coming into contact with skin and clothes.
• Gloves and protective clothing (e.g., plastic aprons) should be used when cleaning surfaces or handling clothing or linen soiled with body fluids. Depending on the context, either utility or single-use gloves can be
used. After use, utility gloves should be cleaned with soap and water and decontaminated with 0.5% sodium hypochlorite solution. Single-use gloves (e.g., nitrile or latex) should be discarded after each use. Perform hand hygiene before and after removing gloves.

- Gloves, masks and other waste generated during at-home patient care should be placed into a waste bin with a lid.
- To contain respiratory secretions, a medical mask should be provided to the patient and worn as much as possible.

Infectious waste. Individuals who cannot tolerate a medical mask should avoid other types of exposure to contaminated items from the patient’s immediate environment (e.g., do not share toothbrushes, cigarettes, eating utensils, dishes, drinks, towels, washcloths or bed linen).

- When HCWs provide home care, they should perform a risk assessment to select the appropriate personal protective equipment and follow the recommendations.
- Caregivers should wear a tightly fitting medical mask that covers their mouth and nose when in the same room as the patient.

Management of contacts

- A contact is a person who has had any of the following exposures:
  - a healthcare-associated exposure, including providing hygiene before and after removing gloves and the mask.
  - direct care for patients with COVID-19 disease, working
  - do not reuse masks or gloves.
  - use dedicated linen and eating utensils for the patient; these items should be cleaned with soap and water after use and may be re-used instead of being discarded.
  - clean and disinfect daily surfaces that are frequently touched in the room where the patient is being cared for, such as bedside tables, bedframes and other bedroom furniture. Regular household soap or detergent should be used first for cleaning, and then, after rinsing, regular household disinfectant containing 0.5% sodium hypochlorite (i.e., equivalent to 5000 ppm or 1 part bleach with HCWs infected with the virus that causes COVID-19 disease, visiting patients or staying in the same environment as a patient with COVID-19 disease;
  - an exposure through working together in close proximity to or sharing the same classroom with a patient with COVID-19 disease;
  - an exposure through traveling with a patient who has COVID-19 disease in any kind of vehicle;
• an exposure through living in the same household as a patient with COVID-19 disease within 14 days after the onset of symptoms in the patient (5).

to 9 parts water) should be applied.

3 An exception may be made for breastfeeding mothers. Considering the benefits of breastfeeding

Most household bleach solutions contain 5% sodium hypochlorite. Recommendations on how and the insignificant role of breast milk in the
to calculate the dilution from a given concentration of bleach can be found at could can continue breastfeeding. The mother should wear a medical mask when she is near her

6 The local sanitary authority should adopt measures to ensure that the waste is disposed of at

a sanitary landfill and not at an unmonitored open dump. 4 Medical masks are surgical or procedure masks that are flat or pleated (some are shaped like a cup); they are held in place by strings that tie around the back of the head.
